

AutoHotkey

2011-05-16 15:38:32 by Southern

AutoHotkey is a free, open-source utility for Windows. With it, you can:

- Automate almost anything by sending keystrokes and mouse clicks. You can write a mouse or keyboard macro by hand or use the macro recorder.

- Create hotkeys for keyboard, joystick, and mouse. Virtually any key, button, or combination can become a hotkey.

- Expand abbreviations as you type them. For example, typing "btw" can automatically produce "by the way".

- Create custom data-entry forms, user interfaces, and menu bars. See GUI for details.

- Remap keys and buttons on your keyboard, joystick, and mouse.

- Respond to signals from hand-held remote controls via the WinLIRC client script.

- Run existing AutoIt v2 scripts and enhance them with new capabilities.

- Convert any script into an EXE file that can be run on computers that don't have AutoHotkey installed.

Getting started might be easier than you think. Check out the quick-start tutorial.
